

Benefits of CI/CD

- Deliver more frequently with a higher release rate: A productive CI/CD pipeline doesn't waste expensive developer resources. More new code can be created and subsequently released the quicker it is released.
- Loyal client base: You may foster customer loyalty and deliver wonderful experiences by maintaining a stable working environment and responding to production requirements quickly.

Benefits of CI/CD

- Reduce Costs and Increase Profits: It standardizes deployment procedures for all projects and, when done correctly, allows teams to thoroughly test each source code modification.
- Simplified rollback: The ability to rollback code quickly and easily allows teams to work more efficiently and quickly resolve problematic code.
- Continuous feedback: A DevOps platform with a single CI/CD workflow allows all team members, including business stakeholders, to see what is occurring, where it is happening, and what might be wrong.
